

OnGuard Managed Services Off-site backup and storage

Data, in all its forms, is the key to a successful business.

Of the companies that lose their data, 90% are out of business within two years and nearly 50% are unable to ever reopen their doors. Small, medium, and large businesses need the same kind of protection to ensure the timely recovery of essential business data. Onsite disasters (hardware failure, theft, sabotage, physical disasters) are the primary contributing factor to data loss. REAC'S Offsite backup protects your company from permanent data loss.

Why choose ONGUARD MANAGED SERVICES OFFSITE BACKUP?

- Fast, efficient, full-featured backup, restore and synchronization solution
 - Traditional file backup and restore of data contained on individual servers and workstations
 - Uses military-strength 256-bit AES encryption to ensure the protection of data.
 - Backup of files located on servers and workstations which meet a specific group set (e.g. financial files, productivity files, images and designs)
 - Synchronization of files across several workstations, servers, and laptops.
 - Synchronization of files between backup servers enabling the creation of redundant backups
 - Synchronization of shared folders
 - Synchronization of folders across multiple workplaces for a user
- Ease of configuration and maintenance
 - Wizard-driven, point-and-click configuration; can be set-up in minutes.
 - Email and event log notifications on task success/failure/warnings
- Apply a single backup task to web, SQL, file servers, etc.
- Provides offsite backup storage via FTP
- Effortless, fast restore thanks to its use of non-proprietary standard Zip archives
- Web-based administration interface
 - While traditional backup solutions need a separate component to configure, manage and monitor tasks, ONGUARD OFF-SITE BACKUP allows you to centralize all backup and restore operations - including status monitoring - via one web-based Administration Console interface.
 - ONGUARD OFF-SITE BACKUP allows you to create one backup/restore task and apply it to one or more machines on your network - saving valuable time in configuring multiple tasks as well as in maintaining them when a change in policy is required
 - Restore function allows selective retrieval of individual files, folders, directories, full or individual backups
 - Designed from the ground up with the busy administrator in mind: Create, assign, manage, delete, analyze and run backup and restore operations remotely or
Users can easily be given the ability to back up and synchronize their own files across different work machines (e.g., workstation, laptop and server)
